Search supplement: COMNET-D-26-03761

The manuscript is a critical narrative survey with a capped supplemental search, not a completed systematic review. The historical 165-key citation baseline is not an included-study count. Existing citation is not an eligibility criterion. The retained OpenAlex/Crossref exports contain 2,618 records and 1,916 normalized report groups. Current report-level status: 171 title/abstract exclusions; 1,745 forwarded to eligibility review; 15 completed full-text assessments (8 retained, 7 excluded); 1,730 pending. This incomplete screening does not establish exhaustive coverage. Historical automated triage labels are prioritization only and must not be mistaken for manual screening or final eligibility.

The frozen protocol, per-query log (including database-specific exported counts), raw JSON exports, normalization records, relevance reassessments and exclusion reasons are preserved below. The exported counts are capped; broad database hit totals are not relevant-study counts. Current counts in complete_eligibility_queue_20261012_summary.json supersede historical triage counts for working screening status. Report groups are not independent study counts.

The targeted revision adds reference_traceability_165.csv, a complete citation-level retrospective register with identity fields, evidence roles, known acquisition route and exact matching rules. It classifies 34 direct BBR evaluations/analyses, 5 mechanism/version materials, 2 related surveys, 15 learning/control comparators and 109 supporting references. Exact DOI matches locate 41 entries; seven exact normalized-title candidates require identity confirmation; 117 are not located by these rules in the capped exports. This register is not full-text eligibility or historical retrieval reconstruction. The original bibliography, retained report queue and query log are supplied for portable regeneration.
